English

INTENDED USE

The COVID-19 & Influenza A+B Antigen Combo Rapid Test is a single-use test kit intended for qualitative detection of nucleocapsid protein antigen of influenza A and B and COVID-19 antigen from nasal swab specimens. This test is intended for home use with self-collected nasal swab samples in individuals aged 12 and older. Sampling from anyone under the age of 12 and over the age of 70 should be performed under the guidance and assistance of their guardian. People who are unable to carry out the test on their own should seek support. The test is intended for symptomatic individuals within 7 onset days or asymptomatic individuals contact with persons who have been diagnosed positive or with individuals suspected to be infected. Positive results are indicative of the presence of influenza and SARS-CoV-2. Individuals who test positive should self-isolate and seek additional care from their healthcare provider. Positive results do not rule out bacterial infection or co-infection with other viruses. Negative results do not preclude influenza and SARS-CoV-2 infection. Individuals who test negative and continue to experience influenza or COVID-like symptoms should seek follow up care from their healthcare provider.

PRINCIPLE

The COVID-19 & Influenza A+B Antigen Combo Rapid Test is an immunochromatographic membrane assay that uses highly sensitive antibodies to detect SARS-CoV-2, Influenza A and B nucleocapsid protein from nasal swab specimens. SARS-CoV-2, Influenza A and B specific antibodies are immobilized onto the test region of the membrane and combined with other reagents/pads to construct a test strip. The test is designed to detection of nucleocapsid protein antigens in nasal swab specimens, which is different from the mutation sites have occurred in the spike protein, so it is theoretically able to detect variants including those in UK, India, South Africa and Brazil.

KIT COMPONENTS

Component	1 Test / Kit	5 Tests / Kit	10 Tests / Kit	20 Tests / Kit	25 Tests / Kit
COVID-19 & Influenza A+B Antigen combo Test	1	5	10	20	25
Extraction tube with buffer	1	5	10	20	25
Sterile nasal swab	1	5	10	20	25
Waste bag	1	5	10	20	25
Workstation	/	/	1	1	1
Package insert	1	1	1	1	1

WARNINGS AND PRECAUTIONS

- Do not use after expiration date. Do not use if kit is damaged or open. Do not reuse the tests.
- Do not drink or smoke in the areas where the specimens or kits are handled.
- Handle specimens as if they contain infectious agents. Discard the testing materials in accordance with local regulations.
- The extraction buffer contains a salt solution if the solution contacts the skin or eyes, flush with copious amounts of water. Do not swallow the buffer. When swallowing the buffer, rinse the mouth thoroughly with water and give plenty of water to dilute the substance. If any discomfort, seek medical attention immediately.
- Children and elder please use the test under the guardian.

STORAGE AND STABILITY

Store unused test devices unopened at 4°C-30°C. If stored at 4°C-6°C, ensure that the test device is brought to room temperature before opening. The test device is stable through the expiration date printed on the sealed pouch. Do not freeze the kit or expose the kit over 30°C.

TEST PROCEDURE

Open the kit box. Check the components before use.

Please read all instructions carefully before you begin.

[Preparation before sampling]

- Get a flat area ready. Make sure it is clean, clear and dry.
- Take off handwashes and/or hand sanitizers. Dry your hands using clean disposable paper towels.
- Wash your hands for 20 seconds. Use soap and water or hand or water sanitizers. Dry your hands using clean disposable paper towels.
- For better protection and avoid cross-contamination, disposable gloves, masks and eye protection (not provided in the package) are recommended.
- Peel the soft tip off the extraction tube and insert into the hole of workstation. (For 1 test/kit and 5 tests/kit, Insert the extraction tube into the hole of the box.)
- Open nasal swab package at the sticky end and take the nasal swab out.
- Gently insert the soft tip of the nasal swab into nostril about 2.5cm (1 inch) for adult.
- Note: For child, the maximum depth of insertion in the nostril may be less than 2.5 cm and should be carefully and appropriately adjusted by the person who collects sample.
- Finally, gently rotate the nostril in a circular motion 5 times or more.
- Move the nasal swab to the right nostril and repeat the previous action. Make sure an adequate sample is collected.
- Insert the nasal swab into the tube which contains extraction buffer.
- Rotate nasal swab at least 8-10 times while pressing nasal swab tip against the bottom and the side of the tube.
- Remove the nasal swab while squeezing and rolling the nasal swab against the sides of the tube to release as much liquid as possible.
- Cover the tube with cap tightly and insert the tube back into the workstation or box.

[Test Procedure]

- Open the sealed pouch and take out the test cassette. For best results, the test should be performed in one hour.
- Hold the tube vertically upside down over the sample well.
- Add 3 drops specimen into each sample well by gently squeezing the sides of the tube, then start the timer.

Wait for colored lines to appear. The test result can be read in 10-15 minutes. DO NOT read after 20 minutes.

[After the testing]

- If you have done the test, put all parts of the kit in the waste bag. Discard the waste bag in accordance with local regulations.
- If you are doing more than 1 test, clean the table with 75% alcohol or sanitiser. Wash your hands between each test.

INTERPRETATION OF TEST RESULT For Flu A+B

Flu B Positive	Flu A Positive	Flu A+B Positive	Negative	Invalid	Invalid	Invalid
• Positive Influenza A*						
Two distinct colored lines appear in the left window. One colored line should be in the control region (C) and another colored line should be in the Influenza A region (A).						
• Positive Influenza B*						
Two distinct colored lines appear in the left window. One colored line should be in the control region (C) and another colored line should be in the Influenza B region (B).						
• Positive Influenza A and Influenza B*						
Three distinct colored lines appear in the left window. One colored line should be in the control region (C) and two colored line should be in the Influenza A region (A) and Influenza B region (B).						
• Invalid						
One colored line appears in the control region (C) of the left window. No apparent colored line appears in the test line region (B/A).						
Control line fails to appear in the left window. Insufficient specimen volume or incorrect procedural techniques are the most likely reasons for control line failure. Review the procedure and repeat the test with a new test Cassette. If the problem persists, discontinue using the test kit immediately and contact your local distributor.						

INTERPRETATION OF TEST RESULT For COVID-19

Packungsbeilage**

CE 2934 IVD REF FCO-6032H Deutsch

- Positive COVID-19***
- Two distinct colored lines appear in the right window. One colored line should be in the control region (C) and another colored line should be in the Test region (T).

Negative:

One colored line appears in the control region (C) of the right window. No apparent colored line appears in the test line region (T).

Invalid:

Control line fails to appear in the right window. Insufficient specimen volume or incorrect procedural techniques are the most likely reasons for control line failure.

This test is intended for home use with self-collected nasal swab samples in individuals aged 12 and older. Sampling from anyone under the age of 12 and over the age of 70 should be performed under the guidance and assistance of their guardian. People who are unable to carry out the test on their own should seek support.

The test is intended for symptomatic individuals within 7 days of symptom onset or for asymptomatic individuals. Therefore, any shade of color in the test line region will vary depending on the concentration of the analyses in the specimen. Therefore, any shade of color in the test line region should be considered positive.

BUILT-IN CONTROL

This test contains a built-in control feature, the C line on the test. The C line develops after adding sample solution. Otherwise, review the whole procedure and repeat with a new device.

WHAT SHOULD I DO AFTER TEST

If the test result is positive	There is currently a suspicion of a COVID-19 or Flu A or Flu B infection ➤ Contact your doctor / general practitioner or the local health department immediately ➤ Comply with local guidelines for self-isolation ➤ To have a PCR confirmatory test performed					
If the test result is negative	An infection may also be present if the test is negative. ➤ If it is suspected, repeat the test after 1 - 2 days, as the virus cannot be accurately detected in all phases of an infection					
If the test result is invalid	Possibly caused by incorrect test execution ➤ Repeat the test ➤ If the test results remain invalid, contact a doctor or a COVID-19 test center					

Note: Do not take any decision of medical relevance without first consulting your medical practitioner

WARNINGS AND PRECAUTIONS

- Clinical study: A comparison was performed using nasal samples collected for the research reagent and nasopharyngeal samples collected for comparative PCR reference testing. The test data listed in below table:

	Influenza A/B	COVID-19				
Reference test result	Positive	Negative	Total	Positive	Negative	Total
Safecare Test	Positive	42	95	0	95	95
	Negative	0	568	15	455	470
Total	42	568	610	110	455	565
Relative Sensitivity	100,00% (95%CI 91,59% ~ 100,00%)	86,36% (95%CI 78,51% ~ 92,16%)				
Relative Specificity	100,00% (95%CI 99,35% ~ 100,00%)	100,00% (95%CI 99,19% ~ 100,00%)				
Overall Agreement	100,00% (95%CI 99,40% ~ 100,00%)	97,35% (95%CI 95,66% ~ 98,51%)				

1. Clinical study: A comparison was performed using nasal samples collected for the research reagent and nasopharyngeal samples collected for comparative PCR reference testing. The test data listed in below table:

2. Cross-reactivity: Cross-reactivity studies are performed to demonstrate that the test does not react with the following microorganisms in the table below at a concentration of 1×10^5 CFU/ml for viruses and 1×10^6 CFU/ml for bacteria.

	Influenza A/B	COVID-19
